

2013 ALS User Meeting  
October 9, 2013, Bldg. 15, Room 300  
Can Diffuse X-Ray Scattering Reveal Protein Dynamics?

***Next generation detectors and software to  
measure diffuse scatter***

Nicholas K. Sauter  
Lawrence Berkeley National Laboratory

Workshop: [http://cci.lbl.gov/dials/oct\\_2013\\_diffuse.htm](http://cci.lbl.gov/dials/oct_2013_diffuse.htm)

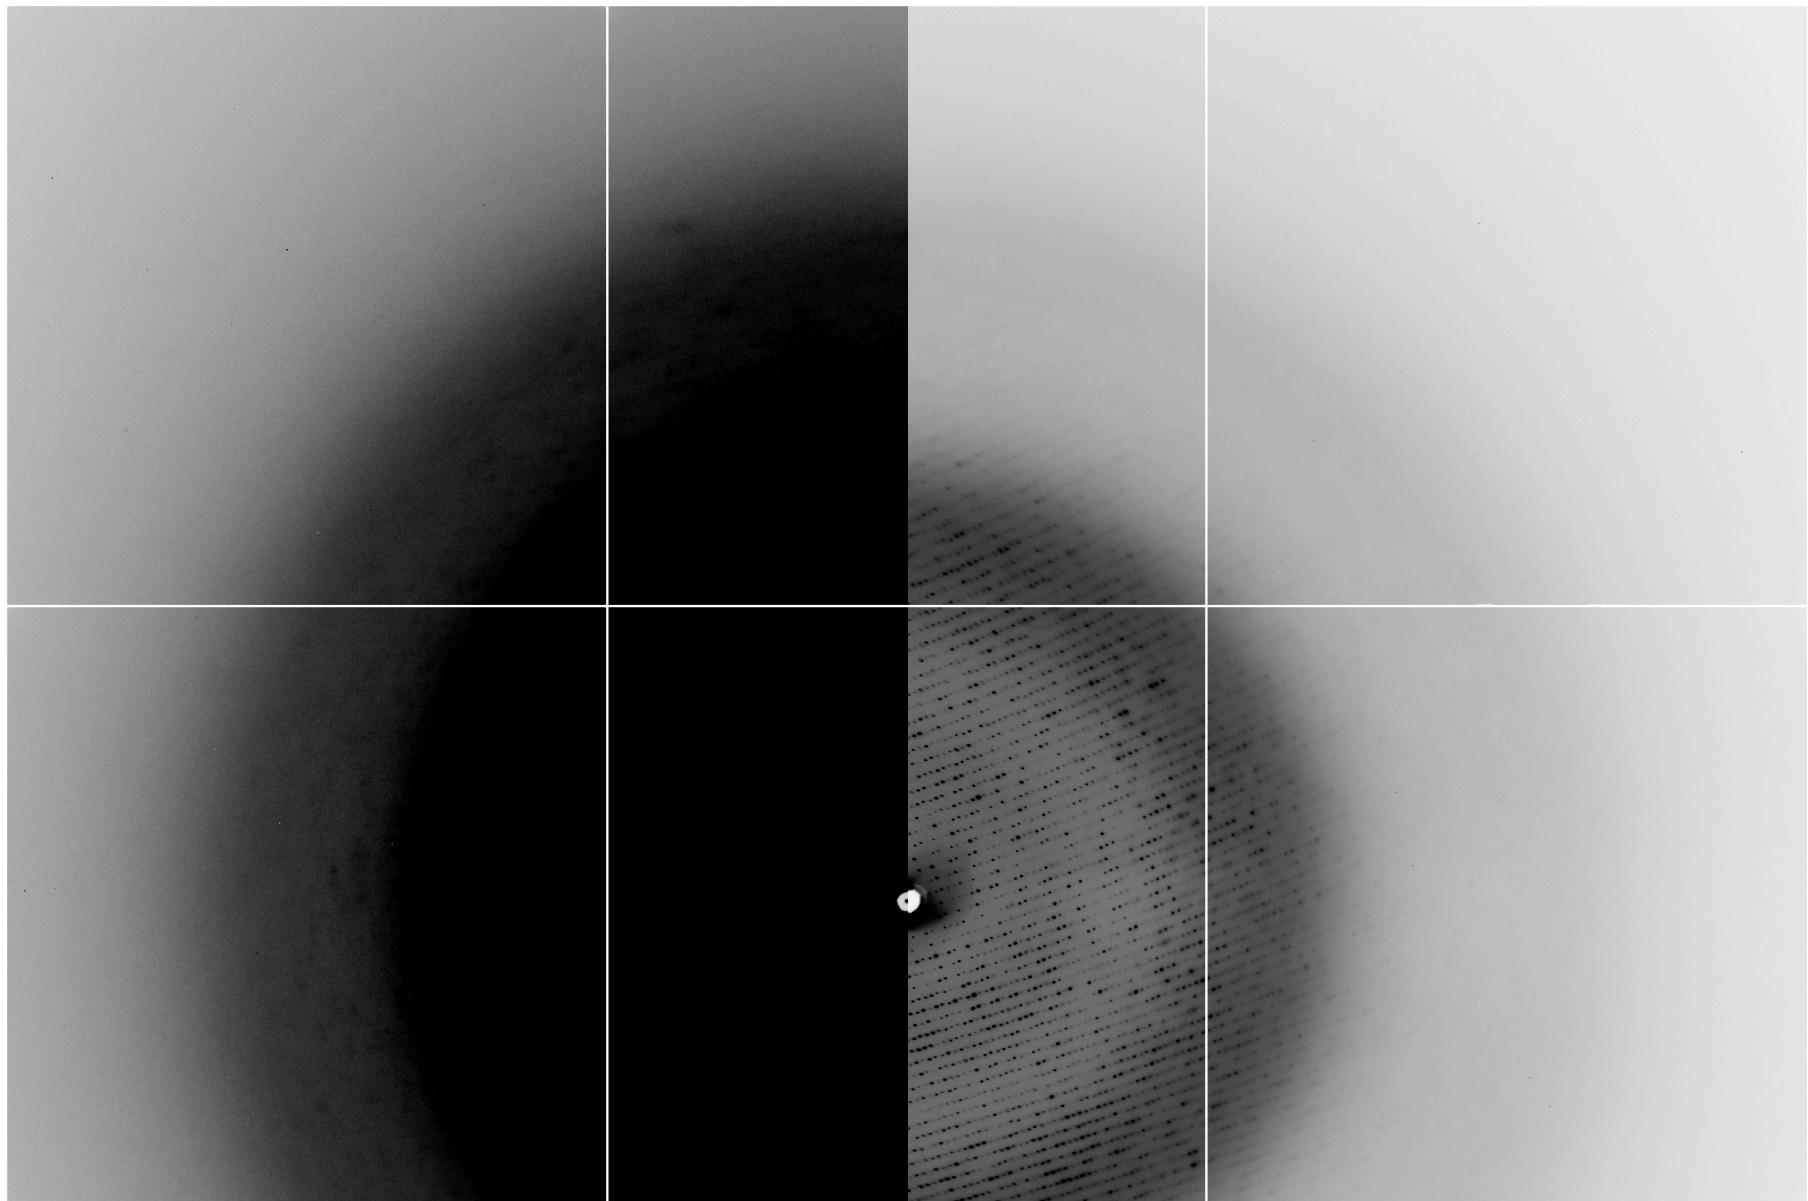

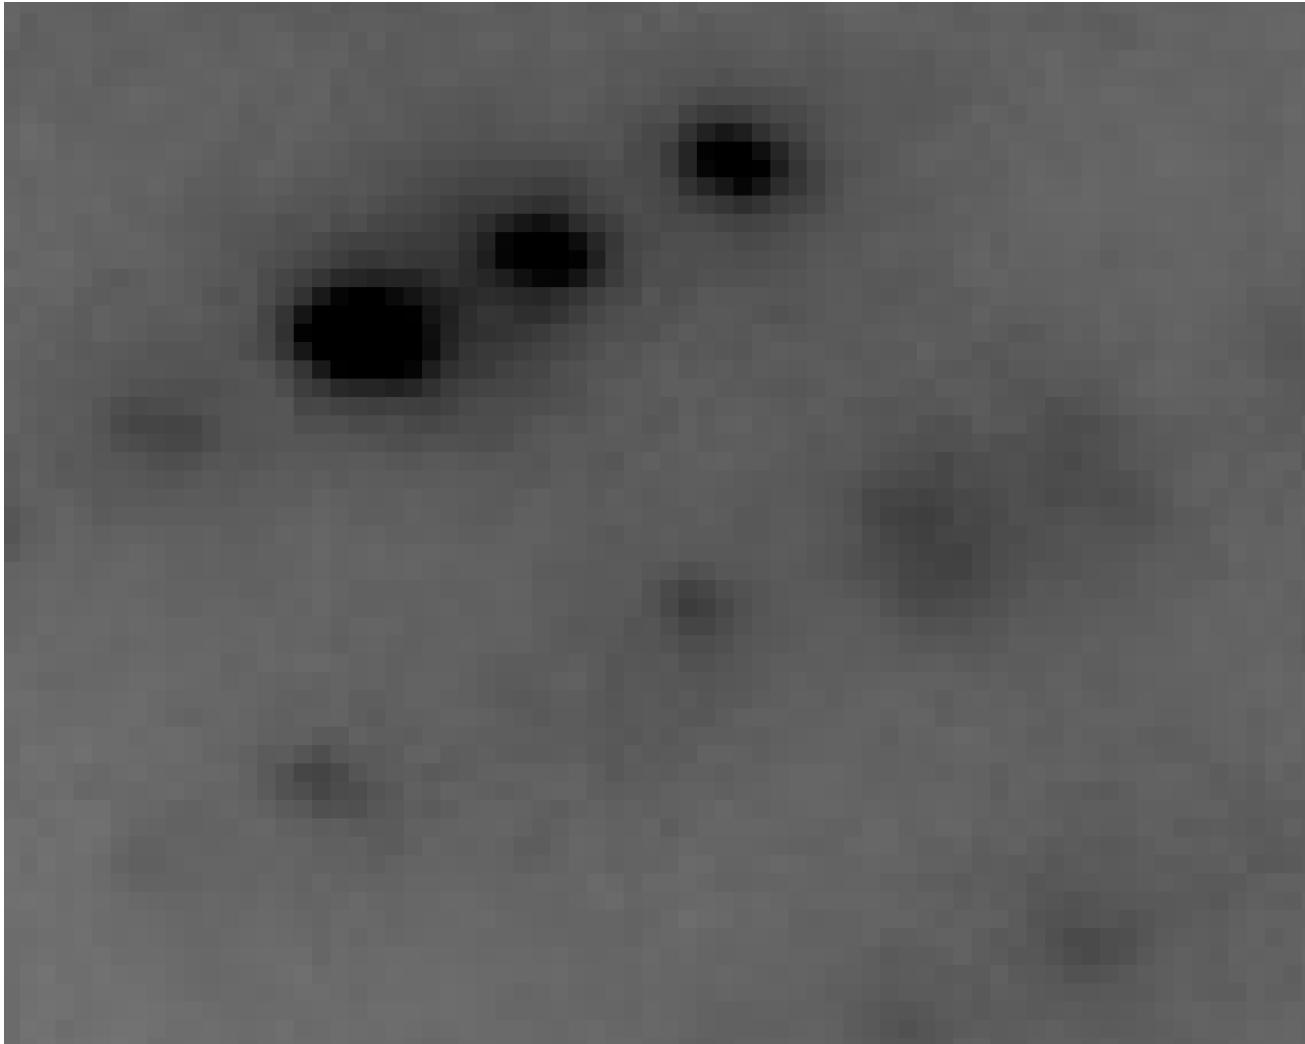

Thermal Diffuse  
Scatter from  
Photosystem II

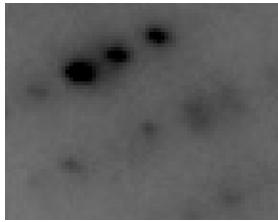

ALS 5.0.2  
Dec 2012

## Thermal Diffuse Scatter from Photosystem II

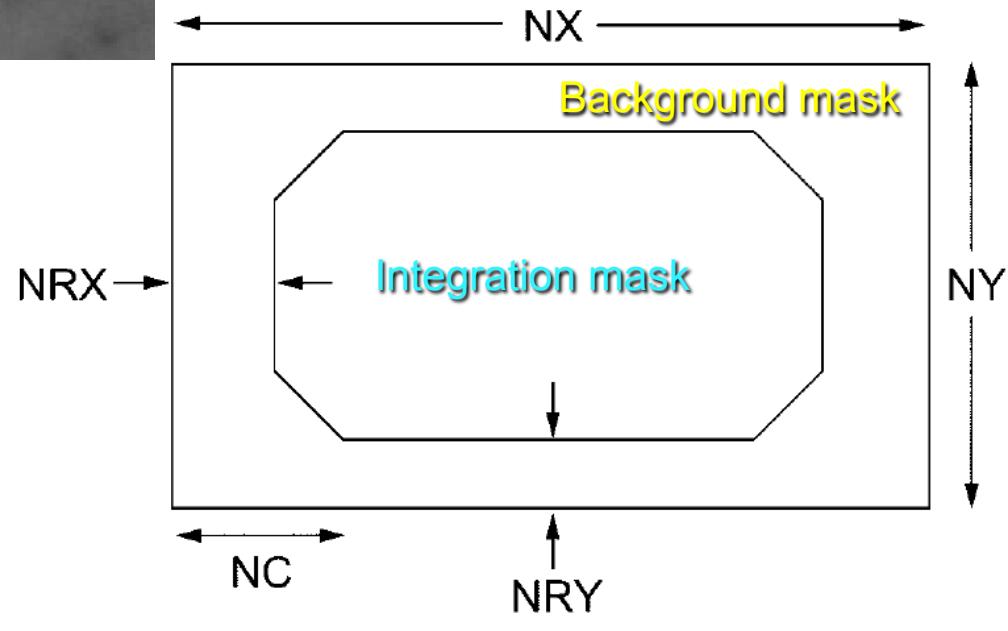

## Challenges for the extraction of diffuse scattering

## Summation integration over 2D masks or profiles

*Mosflm*  
Leslie (1999) *Acta D* **55**, 1696

*2D empirical mask:*

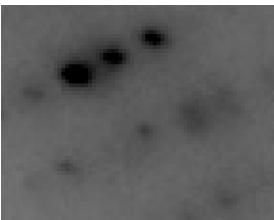

$$I_s = \sum_{i=1}^m (\rho_i - ap_i - bq_i - c)$$

$$\sigma_{I_s}^2 = \sum_{i=1}^m G\rho_i + (m/n)^2 \sum_{j=1}^n G\rho_j$$

$$= G \left[ I_s + I_{\text{bg}} + (m/n)(m/n) \sum_{j=1}^n \rho_j \right]$$

*Fit to a 2D empirical profile:*

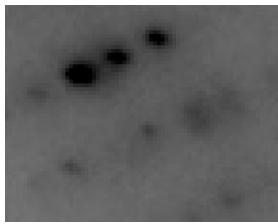

$$R_3 = \sum w_i (KP_i + ap_i + bq_i + c - \rho_i)^2,$$

## 3D empirical profile offers better accuracy

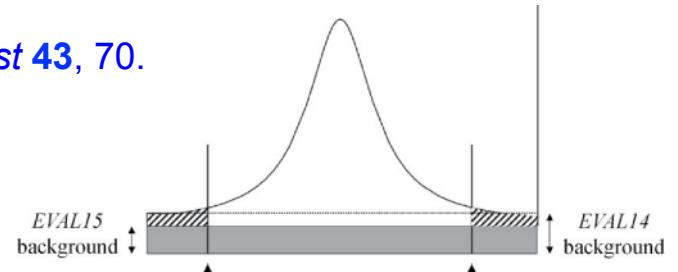

AVERAGE PROFILE OF 379 STRONG REFLECTIONS

- Profile is constructed in reciprocal space, not image space

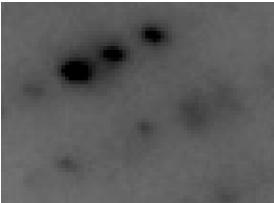

## EVAL15 approach holds promise for MX data

*Eval15: Schreurs [2010] J Appl Cryst 43, 70.*

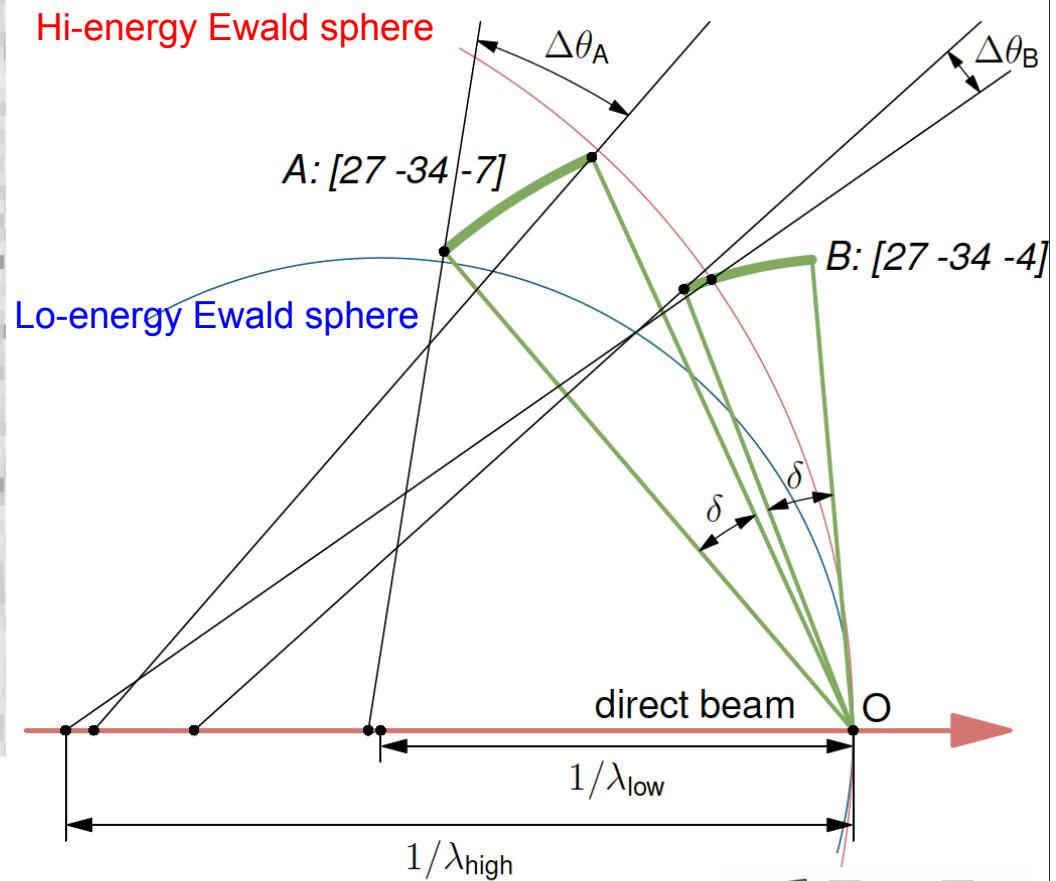

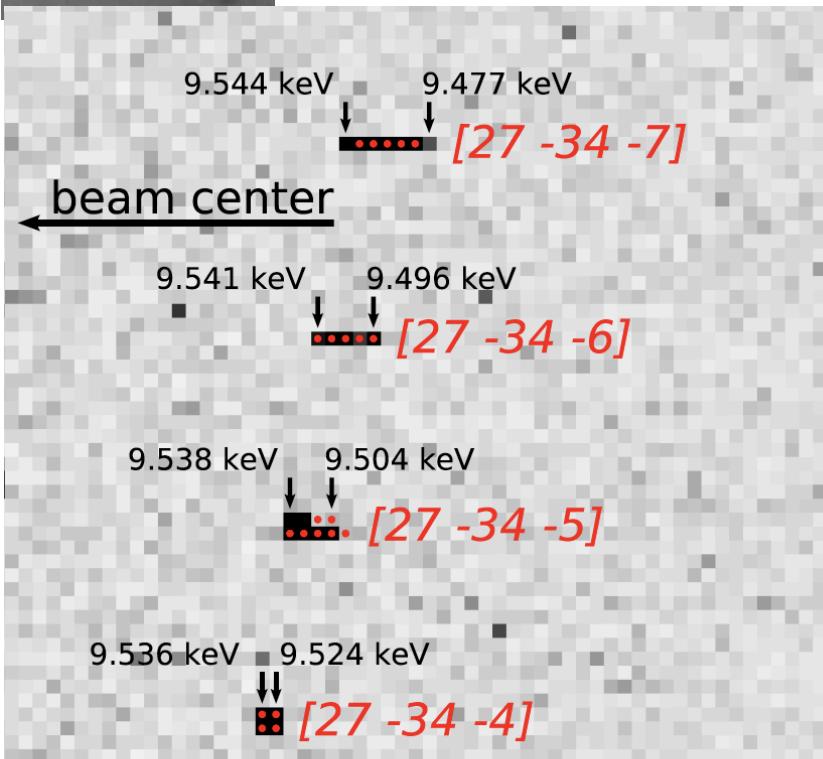

- Bragg spot shapes are modeled explicitly based on underlying parameter model; thus they vary continuously throughout reciprocal space. Input parameters are:
  - Beam profile, divergence, and wavelength
  - Crystal size, shape, and mosaicity
  - Point spread function
- Structure factor intensities are fit by solving a normal matrix.
- The model explicitly treats the pixel intensity as having contributions from [potentially] many nearby Bragg spots.
  - Helps get the background right
  - Framework for deconvoluting overlapping spots
- Could potentially reveal diffuse scattering by subtracting off the profile-fit Bragg spots.
- Use refined structure to bootstrap the structure factor intensities?

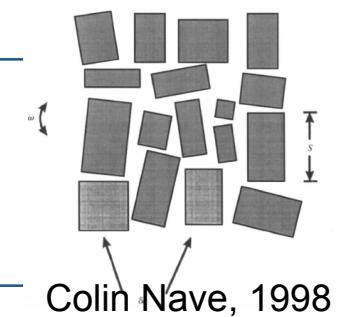

## Parametric profile also used for XFEL Bragg spots

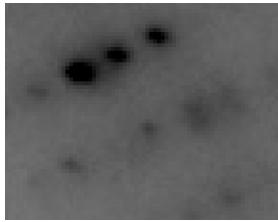

Model: *Dispersion + mosaicity accounts for neighboring-spot variation*

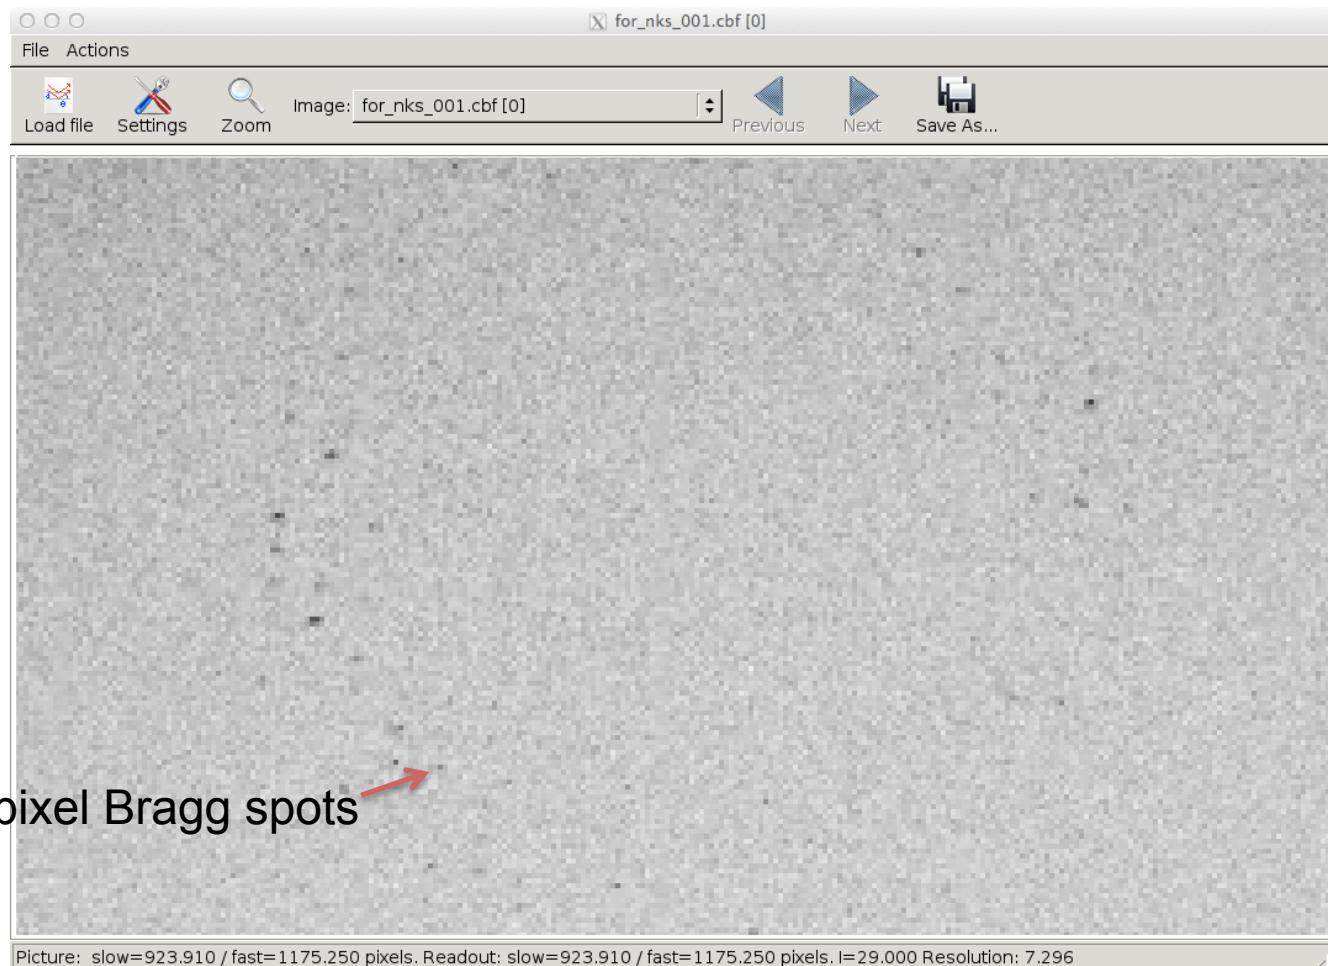

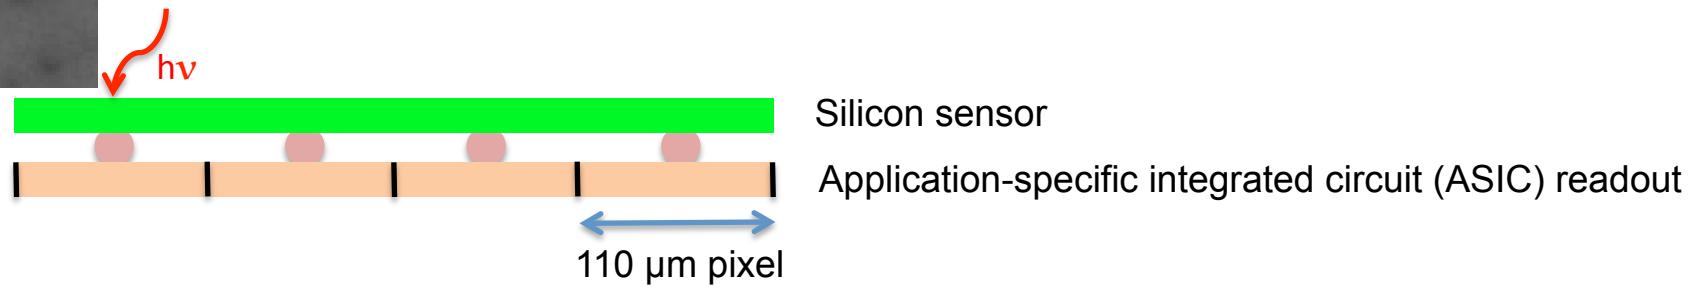

- Wide spots: reciprocal lattice point completely inside energy limits
- Three-parameter model predicts the [near] exact pixels with signal
- $\lambda_{high} = 9.556 \text{ keV}$ ;  $\lambda_{low} = 9.443 \text{ keV}$ ; FW mosaic spread =  $0.174^\circ$

Colin Nave, 1998

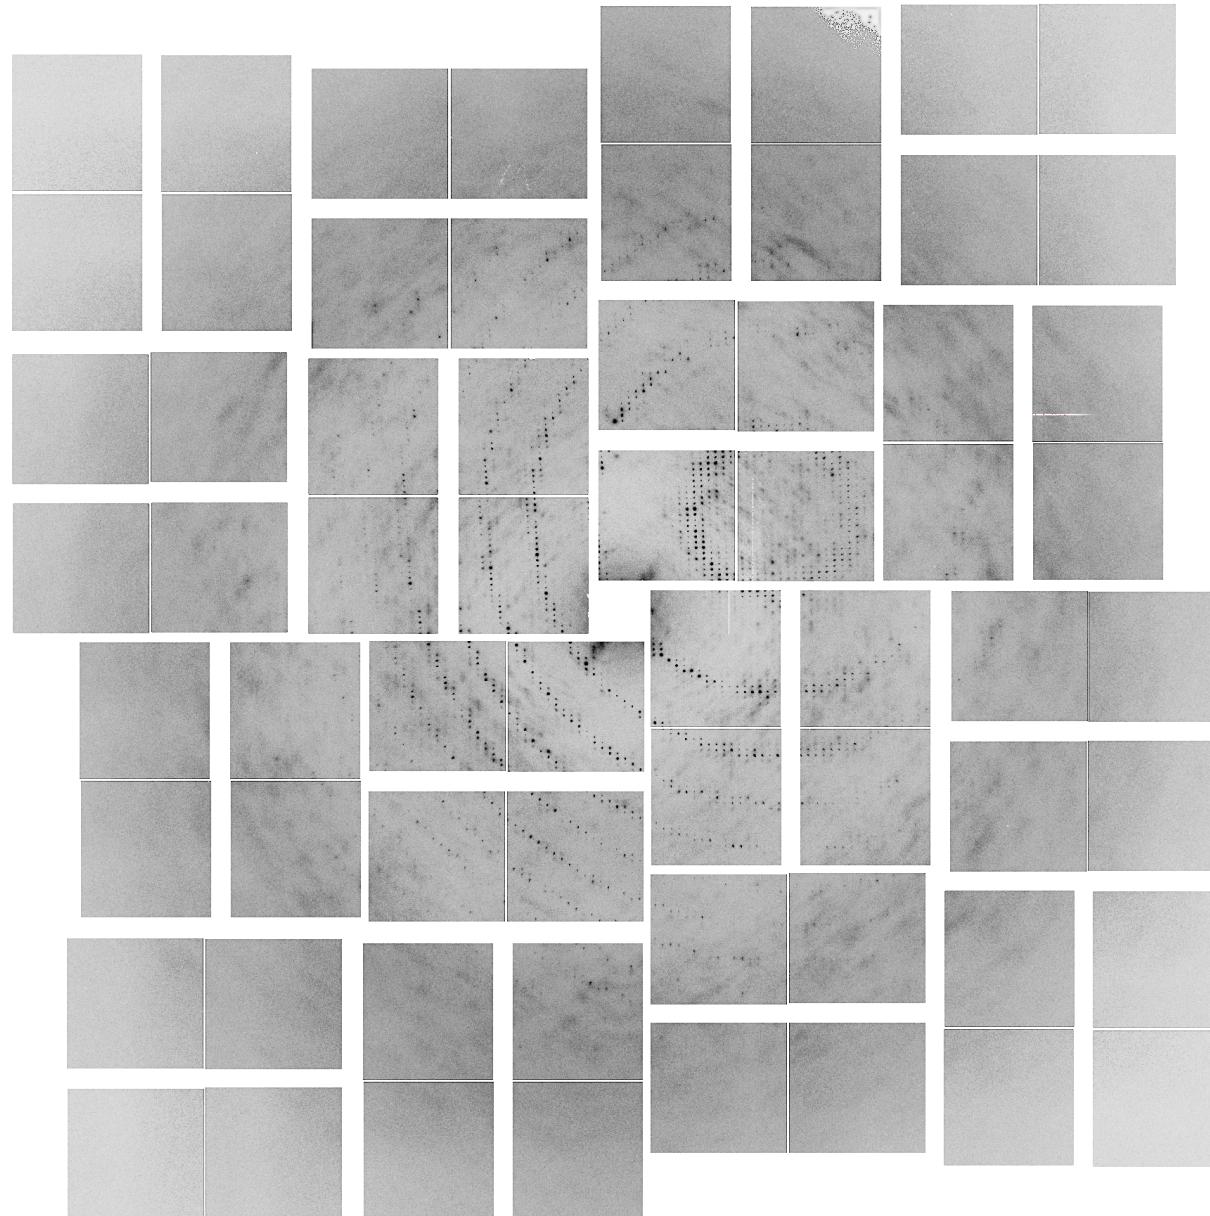

Pixel array detectors would have better spatial resolution

# Advantages of latest (Pilatus3) detectors

- |                       |   |
|-----------------------|---|
| Spatial resolution    | <ul style="list-style-type: none"><li>• Zero point spread: Bragg spots can be 1 px<sup>2</sup></li><li>• Pixel size 172 µm</li><li>• Linear response up to 10<sup>7</sup> s<sup>-1</sup>, deep enough for Bragg + diffuse</li><li>• Sensitivity at photon-counting level (<math>\approx</math> zero instrument noise)</li></ul> |
| Adequate signal depth | <ul style="list-style-type: none"><li>• 20-bit counter depth, overflow controlled</li><li>• No dark current</li><li>• Framing rates of 100 Hz allow extremely fine phi-slicing</li></ul>  |
| Angular resolution    | <ul style="list-style-type: none"><li>• 0.95 ms readout allows shutterless acquisition</li></ul>  |

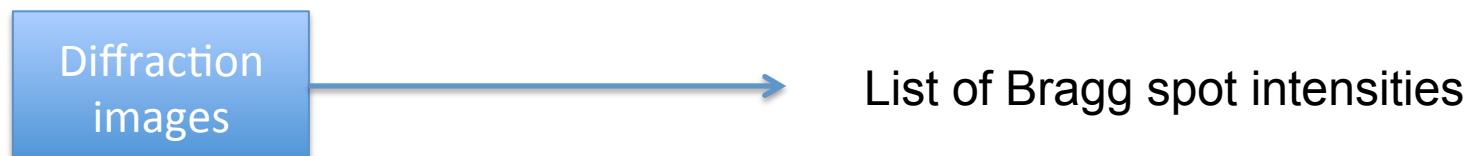

## Diffuse pattern: room temperature / XFEL source / PAD detector

## Data processing: Modeling the diffraction pattern

MOSFLM / XDS

Bragg spots: forward problem

EVAL15--Bragg spots

Diffuse scattering: inverse problem

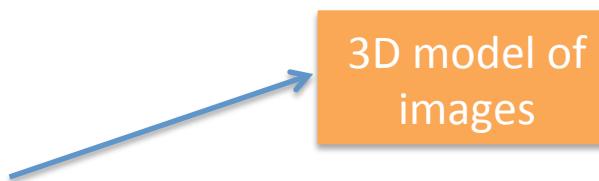

Parameters

Beam properties

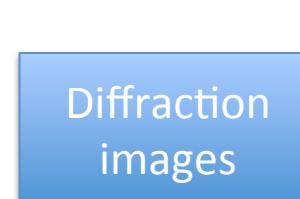

Detector properties & defects

Structure factor intensities

3D model of diffuse scattering

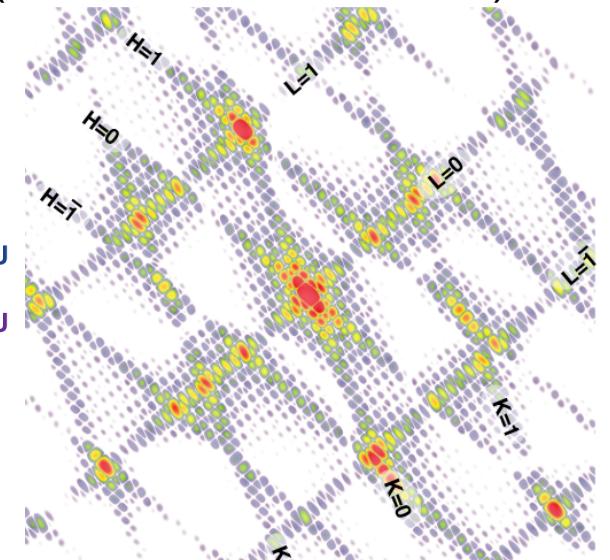

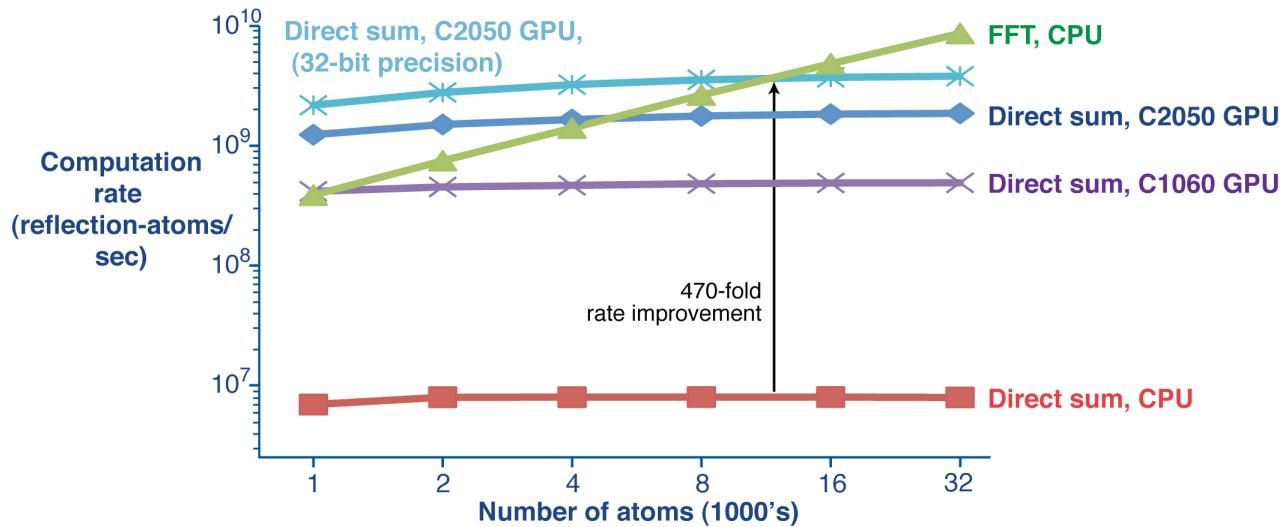

vs.

...role for parallel or GPU computing?

## Stress/strain diffraction becomes tractable with GPUs

- Nvidia Tesla C2050 ( 448 hardware threads,inexpensive)
- Algorithm must be organized in such a way that the same input data is used numerous times by independent output channels.
- Computation of structure factors by direct summation (fractional Miller indices):

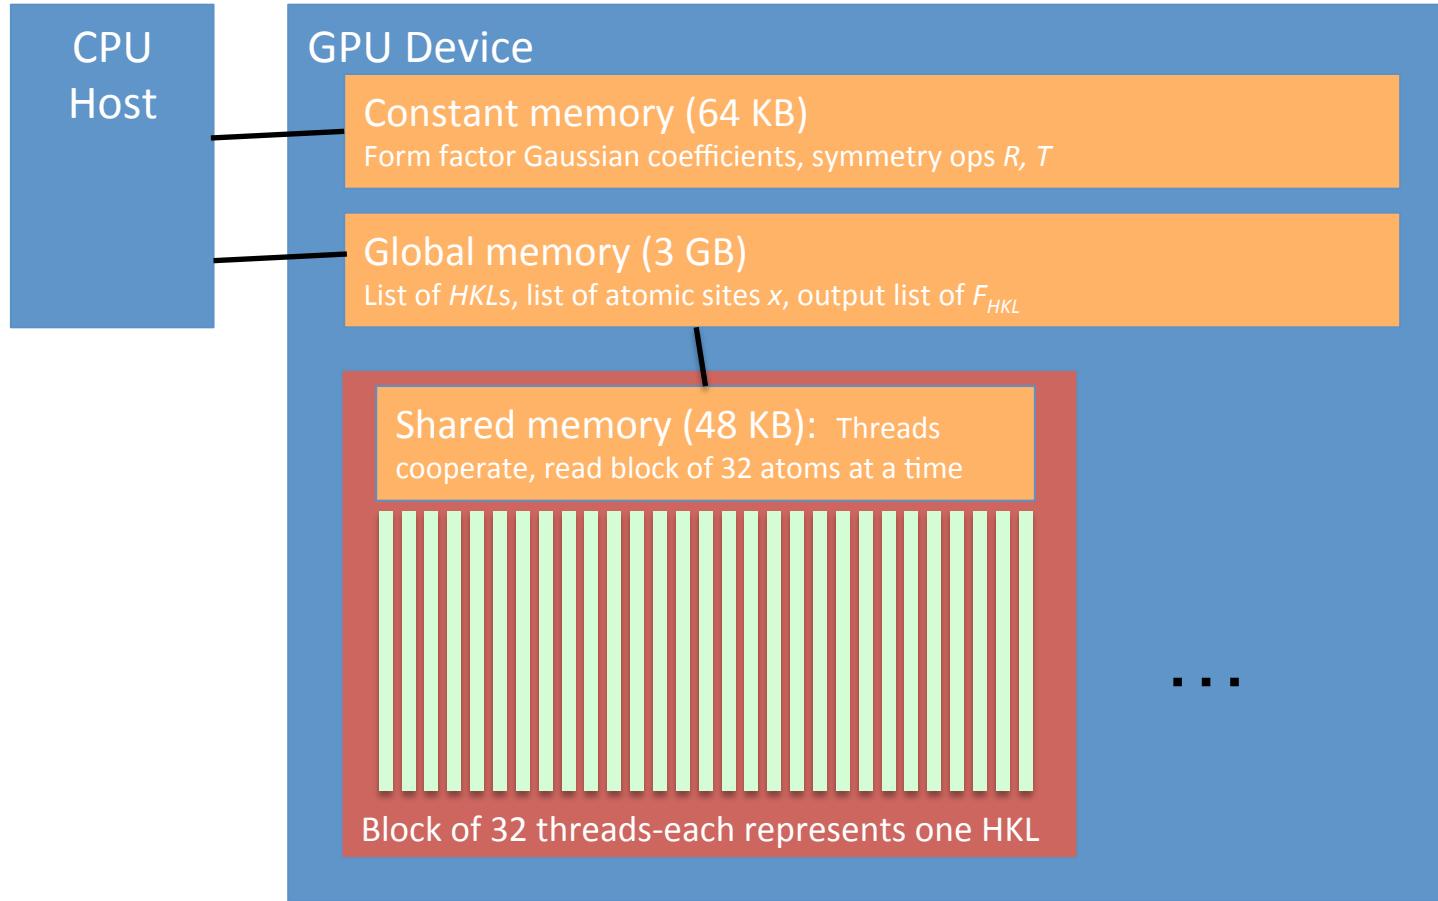

Detailed fringe-pattern on the low-order spots  
(Photosystem I, all atoms)  
simulated in < 2 minutes

$$F_{HKL} = \sum_{\Delta U} \sum_{R} \sum_{T} \sum_{x} f_x \cdot w \cdot e^{2\pi i H \cdot (Rx + T + \Delta U)} \cdot e^{-2\pi^2 u_{iso} d^{*2}}$$

unit rotational translational atomic  
 cells symmetries symmetries sites  
 $\Delta U$   $R$   $T$   $x$

## GPU efficiency: reorganize the algorithm to manage memory

$$F_{HKL} = \sum_{\substack{\text{unit rotational} \\ \Delta U}} \sum_{\substack{\text{translational} \\ R}} \sum_{\substack{\text{atomic} \\ T}} \sum_{\substack{\text{symmetries} \\ sites}} f_x \cdot w \cdot e^{2\pi i H \cdot (Rx + T + \Delta U)} \cdot e^{-2\pi^2 u_{iso} d^{*2}}$$

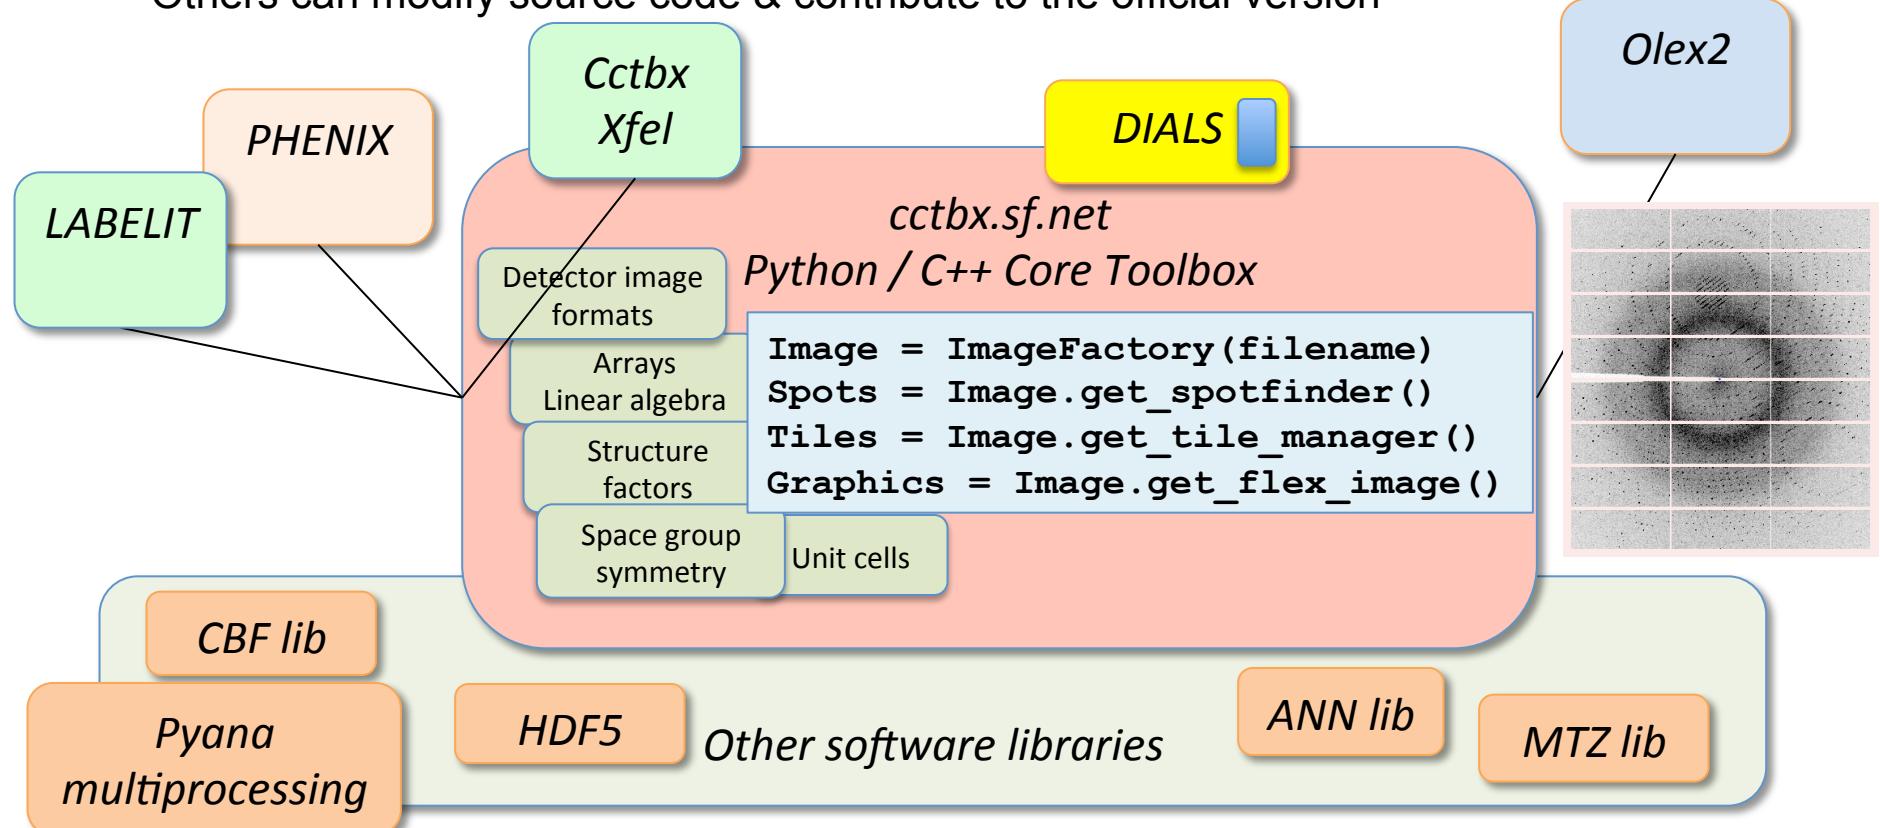

# DIALS: Diffraction Integration for Advanced Light Sources

Software collaboration with common goals but separate funding sources:

- Berkeley Labs, Nick Sauter, NIH funding
- BioStruct-X consortium, Gwyndaf Evans, European Union funding

Approach to software management:

- Open source; BSD-style license to allow distribution of derivative works
- Others can modify source code & contribute to the official version

## DIALS Goals

<http://www CCP4.ac.uk/newsletters/newsletter49/content.html>

- Standard methods for treating all types of detectors
  - Unusual geometry: cylindrical Pilatus detector
  - Subpixel detector corrections (for XFEL)
- Toolbox for unusual experimental configurations
  - Two-color experiments
  - Reticular twinning
  - Multiple lattices
  - Diffuse scattering!
- Parallelization & Speed
- Timeline
  - Twice-yearly workshops: DIALS developers + detector manufacturers + beamline groups
  - XDS + MOSFLM algorithms being tested now

## Diffuse Scattering Goals

- Discussion...
